

# Usage instructions

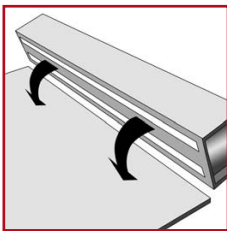

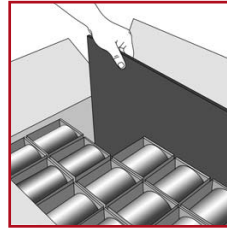

## PALSET4 romwell pallet for self-construction

Content: 9 formats 600 x 400 mm  
18 self-adhesive romwell HANSA pallet skids

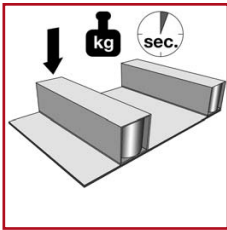

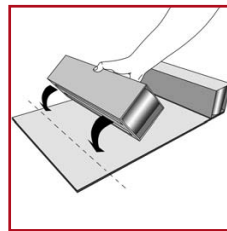

### Assembly

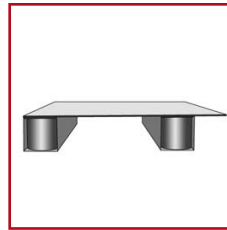

First, two pallet skids are removed from the box.  
Then one of the formats is pulled out and laid down flat

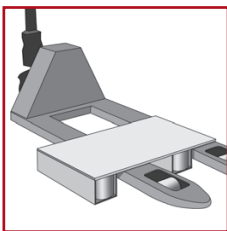

The protective paper is pulled off. The first skid is cemented onto the format flush with the edge. The second skid is cemented on the opposite side of the format – but is offset 10 cm inwards.

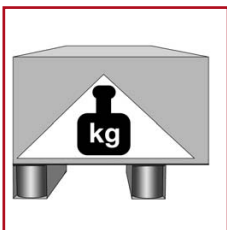

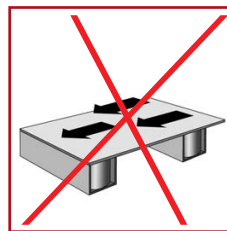

Briefly pressing on forcefully is basically sufficient to join the format and skids to form a firm unit. The romwell display pallet is ready in a very short time with just a few manual operations.

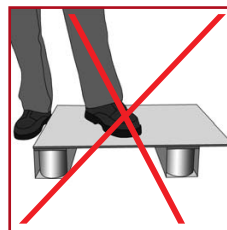

### Handling

When loaded, PALSET4 pallets should only ever be moved using lifting equipment (industrial truck, fork-lift truck, etc.). Sliding to the side must be avoided

Ensure that the load is distributed evenly. The pallet is not suitable for extreme punctiform loading between or outside of the skids. The load's centre of gravity should be located evenly over the skids to ensure stability.
